

Claims

1. Gas cooker burner, of the type comprising a hollow body (2) with internal chamber (3), whose bottom wall features the gas injector (4), with a disk (6) with a large annular crown (6a) centred and positioned in raised position on the border, provided with a dense series of deep radial notches (6b) alternated with shallower radial notches (6d) and covered by
5 a circular cap (7) with protruding border (7a), characterised by the fact that the lower border (7a) is situated near the crown (6a) immediately above the section from which the mixture comes out and goes through the notches (6b and 6d) of the crown (6a), which is provided with an external
10 annular groove (9) along the edge of the upper border and is fed by the air-gas mixture that goes through the shallower notches (6d).
